

Divyanshu Kumar

AI Automation Engineer — LLM Systems, RAG & Workflow Automation

work.kumardivyanshu@gmail.com — +91 7970479325

LinkedIn — GitHub — Portfolio

Summary

AI Automation Engineer building end-to-end systems that replace manual workflows using LLMs, RAG pipelines, and agent-based architectures. Experienced in integrating AI with backend APIs, databases, and real-world systems (security automation, IoT). Focused on delivering production-ready automation with measurable efficiency gains.

Skills

AI Systems: LLMs, RAG, LangChain, Agent Workflows, Prompt Engineering

Automation: n8n, Workflow Orchestration, Event-driven Systems

Backend: Python, FastAPI, Flask, REST APIs

Databases: PostgreSQL, PgVector, ChromaDB

Systems: MQTT, IoT Integration, Microservices

Tools: Docker, Linux, Git

Experience

Sec4Sys Technologies Pvt Ltd

Nov 2025 – Present

AI Automation Engineer (Freelance)

- Built an end-to-end AI automation system for vulnerability remediation, reducing manual analysis effort by 50–70% by automating report parsing, fix generation, and PR creation.
- Developed agent-based pipelines processing vulnerability reports and mapping them to CVE/CWE databases, enabling automated fix suggestions with minimal human intervention.
- Implemented a RAG-based remediation engine improving fix relevance and reducing debugging time from hours to minutes.
- Automated full workflow from ingestion to PR creation, enabling near hands-free remediation for recurring vulnerabilities.
- Deployed modular microservices using Docker, reducing system deployment/setup time by 40%.

Techgenius Institute

Aug 2025 – Present

AI & Robotics Engineer

- Replaced manual employee tracking with an automated workflow system, reducing manual data entry effort by 60%.
- Built AI-driven notification engine generating personalized email and WhatsApp alerts, improving response/acknowledgment rates.
- Developed backend systems integrating IoT devices (NodeMCU + sensors) with AI pipelines, enabling real-time monitoring and decision-making.
- Designed API-driven architecture reducing system latency and improving communication between hardware and backend services.

Projects

AI DevOps Automation Agent (AutoFix AI)

- Built an AI agent that detects code issues from logs/GitHub events and automatically generates fixes using LLM + RAG pipelines.
- Integrated codebase retrieval and semantic search to provide context-aware patch generation.
- Automated issue-to-resolution workflow including fix generation, validation, and pull request creation.
- Reduced manual debugging effort by simulating real-world DevOps automation workflows.

AI Automation Chatbot (RAG System)

- Built document-aware assistant with automated ingestion, embeddings, and semantic retrieval pipeline.
- Implemented agent-driven response system for contextual query handling.

AI Driver Monitoring & Alert System

- Developed real-time system combining computer vision models with IoT sensor data for driver behavior monitoring.
- Automated detection-to-alert pipeline using MQTT and backend decision systems.

Education

B.Tech in Computer Science Engineering

2025

Dumka Engineering College

CGPA: 8.55/10

Achievements

- Winner — Innovathon (BIT Sindri): Smart Vision Quality Testing System
- Finalist — HackFest (IIT ISM): Unified Customer Insights
- Best Final Year Project — AI Driver Assistance System
