

Divyanshu Kumar

Agentic AI Engineer — Autonomous Systems, LLM Orchestration, RAG Pipelines

work.kumardivyanshu@gmail.com — +91 7970479325

LinkedIn — GitHub — Portfolio

Summary

Agentic AI Engineer with end-to-end ownership across the full agent lifecycle — from operational discovery and architecture to prompt engineering, hardening, and production deployment. Specializes in ReAct and Plan-and-Execute architectures, RAG pipelines, and structured tool orchestration. Thrives in ambiguity, ships fast, and iterates on real feedback to bridge demos and production-grade tools.

Skills

Agent Architectures: ReAct, Plan-and-Execute, Multi-step Reasoning, Tool-Calling, Error Recovery Loops

Frameworks: LangChain, LangGraph, CrewAI

LLM APIs: OpenAI (GPT-4), Anthropic (Claude) — structured outputs, function calling, prompt engineering

RAG & Retrieval: Semantic Search, PgVector, ChromaDB, Embedding Pipelines

Reliability: Guardrails, Evaluation Frameworks, Logging & Monitoring, Structured JSON Outputs

Backend & Tools: Python, FastAPI, Flask, REST APIs, Docker, Git, Linux

Frontend: React (lightweight dashboards & human-in-the-loop monitoring interfaces)

Experience

Sec4Sys Technologies Pvt Ltd

Nov 2025 – Present

AI Automation Engineer (Freelance)

- Architected a ReAct-style autonomous remediation agent (report parsing → retrieval → fix generation → PR creation), owning full lifecycle from discovery to production deployment.
- Designed tool-augmented reasoning pipelines with iterative refinement and error recovery loops for automated debugging and patch validation.
- Built structured JSON output pipelines converting raw LLM responses (OpenAI, Anthropic APIs) into deterministic, executable actions.
- Implemented RAG pipelines over CVE/CWE datasets using ChromaDB, grounding agent decisions and reducing hallucinated fixes.
- Introduced evaluation frameworks, logging, and monitoring to debug agent failures; documented reusable agent modules to accelerate team-wide AI enablement.

Techgenius Institute

Aug 2025 – Present

AI & Robotics Engineer

- Embedded with operations teams to identify high-impact automation opportunities; transformed manual workflows into end-to-end agentic pipelines reducing human intervention by ~60%.
- Built intelligent notification agents with context-aware decision-making via API-first architecture; shipped rapid prototypes, iterated on domain expert feedback to reach production readiness.

Selected Achievements

- Deployed autonomous vulnerability remediation agent reducing manual debugging and patching effort by **50–70%** in real-world production workflows.
- Engineered end-to-end agentic pipelines (LLMs + RAG + tool execution) enabling near hands-free resolution of repetitive engineering tasks.
- Transformed manual operational workflows into automated pipelines, improving team efficiency by **~60%** across two organizations.
- Built multi-step reasoning agents with iterative refinement loops, maintaining robustness under incomplete and noisy real-world inputs.

Projects

AutoFix AI — Autonomous DevOps Agent

- Built a Plan-and-Execute agent for semantic codebase understanding, RAG-based context retrieval, patch generation, and iterative fix validation — automating full issue-to-PR lifecycle.
- Hardened robustness under noisy/incomplete inputs; enforced structured output validation for deterministic execution.

Document-Aware AI Assistant (RAG System)

- Automated ingestion, embedding, and semantic retrieval pipeline with agent-driven query handling; exposed clean REST APIs and a React dashboard for human-in-the-loop monitoring.

Education

B.Tech in Computer Science Engineering

Dumka Engineering College

2025

CGPA: 8.55/10
